

Create a Java program using spring boot, spring rest/spring data rest, hibernate, pom.xml

1. Create one simple entity **Topic** with following attributes
 - Id (unique, autogenerated)
 - Name (String)
2. One Topic can have multiple sub-topics as a parent-child relationship (one to many)

3. One Topic can be linked with multiple other Topics including their sub-topics (many to many)

4. Create API find all Topic which are linked with at least three Topics
5. Create API find all Topic which are having one child and one parent
6. Create API find all Topic which are placed at 3rd level in the hierarchy
7. Write proper comments so that anyone can understand your code
